

- **gogent**

A Go framework for LLM agents with built-in OpenTelemetry observability

Github

- Built a Go-native agent framework with ReAct and plan-and-execute loops, typed tools, graph routing, checkpoints, interrupt/resume, guardrails, and evaluation primitives.
- Designed modular provider integrations for Anthropic, OpenAI, Google, and Bedrock alongside MCP and A2A client/server support, keeping orchestration code provider-independent.
- Implemented OpenTelemetry-native tracing, an embedded SQLite span store, a live SSE dashboard, and CLI workflows for inspecting and replaying agent runs from one binary.
- Benchmarked the graph runtime at roughly 240 ns per node transition with zero happy-path allocations and measured about 8.7 microseconds of tracing overhead per provider call.
